pocketROOF

Roof modelling and estimating in your pocket

pocketROOF is a product of AppliCad, an Australian CAD/CAM development company

pocketROOF

Roof modelling and estimating in your pocket

appli-cad

AppliCad Australia are held in high regard for their innovative use of current technology to the benefit of the roofing industry and the AppliCad designers are always on the lookout for a new way to do something better.

Consistent with AppliCad's drive toward better ways to benefit a roofing business, they have developed an estimating program for the WindowsCE based pocket PC. The result is a compact, portable, accessible and very cost-effective solution for the busy roofing contractor in the field.

pocketROOF includes a program that features easy roof drawing commands that allow the estimator to set roof slope, or multiple slopes, draw the roof, assign different line types as eaves, hips valleys etc. and measure 3D roof areas and lengths.

The operator may also store notes with the job using voice, written or text notes. The complete customer base of the roofing contractor may also be stored in the Contacts Manager for easy retrieval plus tasks may be managed and appointments set using the Calendar. These are all standard functions.

The pocketROOF kit includes the WindowsCE pocketPC, all WindowsCE applications and the pocketROOF software pre-installed, cradle, AutoSync software, power and data cables, WindowsCE user manual and pocketROOF user guide.

The **pocketROOF** color screen consists of intuitive task buttons for each command option and the onscreen display shows line lengths as the roof drawing is constructed.

On completion of the day's bids, all jobs may be uploaded to the office bound desktop or notebook PC for further analysis or detailed reporting using AppliCad's Sorcerer program.

Once created, the roof details are stored in **pocketROOF** in a universal file format, they may even be input to your word processor or spreadsheet programs to illustrate your roof situation reports or detailed analysis.

AppliCad Australia sees this device having great appeal to roofing contractors involved in re-roofing or tear-offs, those operators who are running around the countryside preparing material estimates.

With **pocketROOF**, all the job details may be captured and measurements checked whilst still on the site.

You may also drive this for yourself! Check the details below and you can get your very own **pocketROOF** today.
